Chemistry S1: 3.1 Measurements and Their Uncertainty ...
In metrology, measurement uncertainty is the expression of the statistical dispersion of the values attributed to a measured quantity. All measurements are subject to uncertainty and a measurement result is complete only when it is accompanied by a statement of the associated uncertainty, such as the standard deviation.By international agreement, this uncertainty has a probabilistic basis and ...

Measurement uncertainty - Wikipedia
This means its mass lies between 6.722 and 6.724 grams, an uncertainty of 0.001 gram. Every measurement has some uncertainty, which depends on the device used (and the user's ability). All of the digits in a measurement, including the uncertain last digit, are called significant figures or significant digits. Note that zero may be a measured ...

The functional approach to obtain the uncertainty in a function $Z = f(A)$, when A has been measured to be $\bar{A} \pm \alpha A$: $\alpha Z = f\bar{A} + \alpha A - f\bar{A}$. This is shown schematically in the figure. $\bar{A}$ $Z = f(A)$ $\bar{A} + \alpha$ A $f(\bar{A})$ $f(\bar{A} + \alpha A)$ An uncertainty αA in the variable A maps directlyintoanuncertaintyαZ inthefunction $Z = f(A)$.

Section 3.1 – Measurements and Their Uncertainty A measurement is a quantity that has both a number and a unit. The unit typically used in the sciences are those of the International System of Measurements (SI). In scientific notation, a given number is written as the product of two numbers: a coefficient and 10 raised to a power.
